

Pest Problems Livestock Solutions

Complete product guide for
protecting Livestock & Farms from pests

Fly Solutions

Flies cause severe irritation and spread diseases like summer mastitis and pink eye, reducing productivity in cattle by decreasing feed intake and milk production. Calves suffer weight loss in heavily infested areas. All of which results in significant economic losses.

To combat this, a proactive approach to fly control is essential. Lodi's range of products provides a comprehensive solution: **Organ-X Pro-Formula Fly Trap XL** captures and monitors fly populations, while larvicides like **Maggots** and **Larvenol** prevent flies from maturing. For lasting control, **Perbio Choc RTU** offers up to three months of residual protection. Pairing these with fast-acting fly baits like **Twenty One** and **Sheila** ensures farmers can effectively manage fly infestations, keeping their livestock healthy and operations running smoothly.

- A female house fly can lay up to 500 eggs
- Irritation and distraction by flies can lead to a growth reduction of 0.3kg per day in calves and a 500ml decrease in milk production

Rodent Proofing

Once rodent control is established, keeping the area rodent-free is vital to prevent future infestations. Rodent proofing buildings, eliminating clutter, and maintaining bait stations or snap traps are essential steps. Our durable bait boxes, traps, and rodent proofing solutions offer long-term protection, ensuring rodents can't return to damage your farm or spread disease. Our high-quality, tamper proof rodent bait stations are designed to perfectly complement our range of leading rodenticides. We offer snap traps, live capture traps and rodent proofing sealants and deterrent sprays as part of our chemical-free rodent control.

- Rodents spread diseases like leptospirosis and salmonellosis
- A mouse colony contaminates far more feed than it eats
- Rodents reach a lethal dose in one feed of a single feed bait and require multiple feeds of a multi-feed bait to reach the lethal dose

Rodent Solutions

Rodents like rats and mice pose serious risks to cows by spreading diseases such as salmonellosis, leptospirosis, and rabies through contaminated feed and droppings. They also cause economic losses by reducing milk production, increasing veterinary costs, and damaging buildings and food supplies. Farms attract rodents due to plentiful food and nesting sites. Effective control involves preventing their entry, removing food and water sources, and considering rodenticide control methods.

Lodi UK offers the perfect all-in-one solution to tackle these rodent problems. Our **Gems range** features three powerful anticoagulant actives: **Brodifacoum**, a single-feed and multi-feed baits **Bomadiolone** and **Difenacoum** - available in grain, paste, and block formulations to suit any farms needs. For those worried about secondary poisoning, **Lodi Harmonix** uses the innovative **Cholecalciferol**, controlling rodents in half the time with reduced risk of secondary poisoning to non-target species.

For fast-acting mouse control, **Black Pearl** delivers results in under 24 hours. If you have a rodent problem, Lodi UK has the solution.

- Our snap traps are used by professional pest controllers with highly durable springs
- Bait stations are a legal requirement for baiting around buildings with anti-coagulants
- Use traps or monitoring baits to ensure you are on top of infestations quickly
