

Pest Problems Equine Solutions

Complete product guide for
protecting Horses & Farms from pests

Rodent Solutions

Rodents in horse environments can spread diseases like leptospirosis and salmonella through contaminated feed and water, and cause extensive damage by chewing through wood, wires, and insulation. They pose a serious threat to both horse health and property. Lodi's range of rodenticides provides an effective solution to keep stables rodent-free, protecting both your horses and your assets.

Lodi UK offers the perfect all-in-one solution to tackle these rodent problems. Our **Gems range** features three powerful anticoagulant actives: **Brodifacoum**, a single-feed bait and multi-feed baits **Bromadiolone** and **Difenacoum** - available in grain, paste, and block formulations to suit any farms needs. For those worried about secondary poisoning, Lodi **Harmonix** uses the innovative Cholecalciferol, controlling rodents in half the time with minimal risk.

For fast-acting mouse control, **Black Pearl** delivers results in under 24 hours. If you have a rodent problem, Lodi UK has the solution.

- Rodents spread diseases like leptospirosis and salmonella
- Mice are incontinent - a colony contaminates far more feed than it eats
- Rodents gnaw wiring, causing fires and damage
- Rodent infestations are more common than you think

Fly Solutions

Flies can seriously impact horses by transmitting diseases like equine infectious anaemia, causing painful bites, and irritating their eyes. They also lay eggs in wounds, delaying healing and producing maggots. Constant stomping to ward off flies can damage hooves, leading to lameness. Regular stable cleaning is essential, and Lodi's range of fly solutions offers effective protection.

Proactive approach to fly control is essential. Lodi's range of products provides a comprehensive solution: **Organ-X Pro-Formula Fly Trap XL** captures and monitors fly populations, while larvicides like **Maggots** and **Larveno** prevent flies from maturing. For lasting control, **Perbio Choc RTU** offers up to three months of residual protection. Pairing these with fast-acting fly baits like **Twenty One** and **Sheila** ensures stable managers can effectively control fly infestations, keeping their horses healthy and operations running smoothly.

- A female house fly can lay up to 500 eggs
- House flies are attracted to the moisture in the horses eye
- Sheila and Twenty One are the only fly baits to kill both on ingestion and contact
